11) A child in a mathematics classroom, writes

$$4.78 > 4.9$$

$$7.26 > 7.3$$

Which of the following is the most appropriate reason for this error? The child

- (1) is careless and inattentive in the class.
- (2) needs to be given more similar problems to practise.
- (3) has over-generalized the rule that a three-digit number is greater than a two-digit number.
- (4) has mathematical learning disabilities.

गणित की कक्षा में एक बच्चा लिखता है

$$4 \cdot 78 > 4 \cdot 9$$

$$7 \cdot 26 > 7 \cdot 3$$

निम्नलिखित में से कौन-सा इस त्रुटि के लिए सर्वाधिक उपयुक्त कारण है ?

- (1) बच्चा लापरवाह है और कक्षा में सतर्क नहीं है।
- (2) बच्चे को अभ्यास के लिए अधिक समान प्रश्न देने की आवश्यकता है।
- (3) बच्चे ने इस नियम, कि एक तीन-अंकीय संख्या किसी दो अंकीय संख्या से बड़ी होती है, का अति व्यापकीकरण कर लिया है।
- (4) बच्चे में गणितीय अधिगम अयोग्यताएँ हैं।

- (1) Not true since mathematics is a subject which requires exact answers.
- (2) True since students may approximate the answers as it is difficult to remember many formulae and algorithms.
- (3) True since it helps in saving time in solving problems.
- (4) True since solutions to many scientific, mathematical and everyday problems involve estimation and approximation.

राष्ट्रीय पाठ्यचर्या रूपरेखा 2005 के अनुसार, यह कथन "अनुमान एवं सन्निकटन कौशल के विकास में स्कूली गणित एक सार्थक भूमिका निभा सकता है।"

- (1) सत्य नहीं है क्योंकि गणित एक ऐसा विषय है जिसमें सटीक उत्तरों की आवश्यकता होती है।
- (2) सत्य है, क्योंकि विद्यार्थियों के लिए कई सूत्र और कलन विधियों को याद करना कठिन है और वे उत्तरों का सन्निकटीकरण कर सकते हैं।
- (3) सत्य है, क्योंकि यह प्रश्न को हल करने में समय की बचत करता है।
- (4) सत्य है, क्योंकि कई वैज्ञानिक, गणितीय और प्रतिदिन की समस्याओं के हल में अनुमान एवं सन्निकटीकरण निहित है।

1) **Directions :** Read the passage given below and answer the questions that follow by selecting the correct / most appropriate options.

1. Scientists discovered that some naturally-occurring lake bacteria grow faster and more efficiently on the remains of plastic bags than on natural matter like leaves and twigs. The study involved sampling 29 lakes across Scandinavia between August and September 2019.

2. The carbon compounds in plastic are broken down by bacteria and used as food for their growth. The effect is quite apparent: when plastic pollution raised the overall carbon level in lake water by just 4%, the rate of bacterial growth more than doubled. According to the findings, the plastic pollution in lakes is likely 'priming' the bacteria for rapid growth. It's almost like the plastic pollution is getting the bacteria's appetite going. This suggests that plastic pollution is stimulating the whole food web in lakes, because more bacteria means more food for the bigger organisms like ducks and fish.

3. Enriching waters with particular species of bacteria could be a natural way to remove plastic pollution from the environment according to the researchers. Lake bacteria were found to prefer plastic-derived carbon compounds over natural ones. The scientists believe this is because the carbon compounds from plastics are easier for the bacteria to break down and use as food.

4. The effect varied depending on the diversity of bacterial species present in the lake water — lakes with more different species were better at breaking down plastic pollution. The study also found that bacteria removed more plastic pollution in lakes that had fewer unique natural carbon compounds. This is because the bacteria in the lake water had fewer other food sources.

5. The results will help to prioritize lakes where pollution control is most urgent and to identify microbes that could be harnessed to help break down plastic waste and better manage environmental pollution.

6. This does not condone ongoing plastic pollution, the scientists caution. Some of the compounds within plastics can have toxic effects on the environment, particularly at high concentrations. If a lake has a lot of plastic pollution, but low bacterial diversity and a lot of different natural organic compounds, then its ecosystem will be more vulnerable to damage.

This suggests that plastic pollution is stimulating the whole food web in lakes, because more bacteria means more food for the bigger organisms like ducks and fish.

3. Enriching waters with particular species of bacteria could be a natural way to remove plastic pollution from the environment according to the researchers. Lake bacteria were found to prefer plastic-derived carbon compounds over natural ones. The scientists believe this is because the carbon compounds from plastics are easier for the bacteria to break down and use as food.

4. The effect varied depending on the diversity of bacterial species present in the lake water — lakes with more different species were better at breaking down plastic pollution. The study also found that bacteria removed more plastic pollution in lakes that had fewer unique natural carbon compounds. This is because the bacteria in the lake water had fewer other food sources.

5. The results will help to prioritize lakes where pollution control is most urgent and to identify microbes that could be harnessed to help break down plastic waste and better manage environmental pollution.

6. This does not condone ongoing plastic pollution, the scientists caution. Some of the compounds within plastics can have toxic effects on the environment, particularly at high concentrations. If a lake has a lot of plastic pollution, but low bacterial diversity and a lot of different natural organic compounds, then its ecosystem will be more vulnerable to damage.

According to the scientists, what could be harnessed to help break down plastic waste?

- (1) bacteria
- (2) microbes
- (3) bigger organisms
- (4) leaves and twigs

8) **Directions :** Read the passage given below and answer the questions that follow by selecting the correct / most appropriate options.

1. Scientists discovered that some naturally-occurring lake bacteria grow faster and more efficiently on the remains of plastic bags than on natural matter like leaves and twigs. The study involved sampling 29 lakes across Scandinavia between August and September 2019.

2. The carbon compounds in plastic are broken down by bacteria and used as food for their growth. The effect is quite apparent: when plastic pollution raised the overall carbon level in lake water by just 4%, the rate of bacterial growth more than doubled. According to the findings, the plastic pollution in lakes is likely 'priming' the bacteria for rapid growth. It's almost like the plastic pollution is getting the bacteria's appetite going. This suggests that plastic pollution is stimulating the whole food web in lakes, because more bacteria means more food for the bigger organisms like ducks and fish.

Read the following statements :

A: Lake bacteria prefers natural carbon compounds over plastic derived ones.

B: Plastic pollution increases the rate of bacterial growth.

(1) A is correct, B is incorrect.

(2) A is incorrect, B is correct.

(3) Both A and B are correct.

(4) Both A and B are incorrect.

A simple child, that lightly draws its breath,
And feels it's life in every limb, what should it know of death?
I met a little cottage girl: she was eight years old, she said;
Her hair was thick with many a curl that clustered round her head.
She had a rustic, woodland air, and she was wildy clad:
Her eyes were fair, and very fair; – her beauty made me glad.
"Sisters and brothers, little maid, how many may you be?"
"How many? Seven in all," she said, and wondering looked at me.
"And where are they? I pray you tell." She answered, "Seven are we;"
And two of us at Conway dwell, and two are gone to sea.
"Two of us in the churchyard lie, my sister and my brother;
And, in the churchyard cottage, I dwell near them with my mother."
