- Contemporary critics of scientific anthropology note that ethnographies have traditionally been written as if anthropologists were an omniscient observer. Clifford Geertz argued that anthropologists construct texts using literacy devices that seek to establish their credentials for objective observation and ethnographic competence. All-knowing, dispassionate, third-person narrative style is coupled with a smattering of native terms to stamp the anthropologists' authority. The ability of the anthropologist to get readers to take what they read seriously has less to do with their factual look or conceptual elegance than with their ability and capacity to convince readers of what they say as a result of having actually penetrated another form of life and of truly knowing after having been there. And that, persuading that this offstage miracle has occurred, is where writing comes in. According to Stephen Tyler, "Reason is simply the means by which we justify the lies we tell." No one has ever demonstrated the independence of reason of logic and mathematics from the discourses that constitutes them. Science, following post modernists is held to be a cultural construct of Western society that has historically oppressed powerless groups. Hence, those who claim knowledge to be scientific and objective are complicit in this exploitation.
