**Read the passage given below and answer questions:**

If unpleasant things happen in our daily life, we immediately pay attention to them but do not notice other pleasant things. We experience these as normal or usual. This shows that compassion and affection are part of human nature.

Compassion or love has different levels; some are more mixed than others with desire or attachment. For example, parents' attitudes toward their children contain a mixture of desire and attachment with compassion. The love and compassion between husband and wife-especially at the beginning of marriage when they don't know the deep nature of each other-are on a superficial level. As soon as the attitude of one partner changes, the attitude of the other becomes opposite to what it was. That kind of love and compassion is more of the nature of attachment. Attachment means some kind of feeling of closeness projected by oneself. In reality, the other side may be very negative, but due to one's own mental attachment and projection, it appears as something nice. Furthermore, attachment causes one to exaggerate a small good quality and make it appear 100 percent beautiful or 100 percent positive. As soon as the mental attitudes change, that picture completely changes. Therefore, that kind of love and compassion is, rather, attachment.

**Read the following paragraph and answer the questions:**

Colonial educational policy should not be equated with Macaulay's 1835 Minute on Education, though that is done quite often. The Minute had denounced Indian cultures for their alleged poverty and suggested that Western texts alone should be taught at the higher levels of education, primarily through the English language. There were, actually, numerous variations across time and space. The medium of the English language was established only after a bitter debate among Company officials who struggled hard to overcome the opposition of the Orientalists (in the narrower sense of that word) among them. The latter had wanted the not particularly lavish sum of Rs.1 lakh, assigned to education by the Charter Act of 1813, to be spent on Sanskrit and Perso-Arabic institutions alone. The best-known Indian intervention in that debate, by Rammohan Roy in 1823, clearly wanted a combination of the English medium with emphasis upon scientific education in ways very different from Macaulay's preference for 'liberal', literary training. There were also some advocates for a development of the vernacular media. Notable instances would include William Adam in late 1830s Bengal, he being the author of a famous report on indigenous education; the Company-funded Delhi College in pre-1857 Delhi, which used the Urdu medium and encouraged vernacular translations of books on Western science; the effort to promote vernacular primary education in Urdu and Hindi by Lieutenant Governor Thomason of the North-Western Provinces in the 1850s; and the initial support given by some Bengal official to Iswarchandra Vidyasagar's drive for popular education through the Bengali medium and his founding of some girls' schools in that decade.

Read the following paragraph and answer the questions:

The term *science* may be thought of as an approach to the gathering of knowledge rather than as a field or subject matter. Science, put simply, consists of two primary functions: (1) the development of theory and (2) the testing of substantive hypotheses that are deduced from theory. The scientist, therefore, is engaged in the use, modification, and/or creation of theory. The scientist may emphasize an empirical approach in which data collection is the primary method, a rational approach in which logical and deductive reasoning is primary, or a combination of these approaches, which is most common. Regardless of the emphasis the scientist begins with a set of ideas that direct the effort and with a goal that entails the development or testing of theory.

By attempting to apply the rigorous, systematic observation analysis used in the physical and biological sciences to areas of social behavior, the social sciences have grown and have advanced humanity's knowledge of itself. The fields of anthropology, economics, education, political science, psychology, and social psychology have become recognized as sciences by many authorities. To the extent that these fields are founded on scientific methodology, they are sciences. Some reject this concept, still defining science in terms of subject matter rather than methodology. Historically their position can be readily explained. Because scientific methods were first used in the investigation of physical phenomena, tradition has identified science with the physical world. Only within the last century has the methodology of science been applied to the study of various areas of human behavior. Because these are newer areas of investigation, their results have not achieved the acceptance and status that come with the greater maturity and longer tradition of the physical sciences.

The uniformity of nature is a reasonable assumption in the world of physical objects and their characteristics, but in the area of social behavior such assumptions are not warranted. Human nature is much more complex than the sum of its many discrete elements, even if they could be isolated and identified. Because human nature is so complex, it is much more difficult to develop sound theories of human behavior than to predict occurrences in the physical world.

**SubQuestion No : 146**

**Q.146** Why prediction of human behaviour is not easy?

1. because human behaviour is the sum total of many discrete elements
2. because it is a newer area of investigation
3. because scientific methodologies can be applied in physical and biological sciences only
4. because human nature is complex

Because these are newer areas of investigation, their results have not achieved the acceptance and status that come with the greater maturity and longer tradition of the physical sciences.

The uniformity of nature is a reasonable assumption in the world of physical objects and their characteristics, but in the area of social behavior such assumptions are not warranted. Human nature is much more complex than the sum of its many discrete elements, even if they could be isolated and identified. Because human nature is so complex, it is much more difficult to develop sound theories of human behavior than to predict occurrences in the physical world.
