Read the following passage and answer the questions :

John B. Watson, an animal experimentalist who argued that all human action is merely a conditioned response to external environmental stimuli, first popularized stimulus-response psychology. Watson's theory became known as behaviorism in recognition of its narrow focus on isolated human behaviors. Behaviorists rejected psychology's widely held assumption that higher mental processes (that is, conscious thought or reflection) ordinarily control human action. In contrast to such "mentalist" views, behaviorists argued that the only purpose served by consciousness was to rationalize behaviors after they are triggered by external stimuli. Behaviorists attempted to purge all mentalist terms from their theories and to deal strictly with observable variables - environmental stimuli on the one hand and behaviors on the other. By studying the associations that existed between specific stimuli and specific behaviors, behaviorists hoped to discover previously unknown causes for action. One of the central notions in behaviorism was the idea of conditioning. Behaviorists argued that most human behavior is the result of conditioning by the external environment. We are conditioned to act in certain ways by positive and negative stimuli - we act to gain rewards or avoid punishments.

Comprehension:

Read the following passage and answer the questions :

Modern technology has been criticized because it is based on the assumption that nature is an inexhaustible source for the satisfaction of man's escalating resource needs and a limitless sink for his wastes. Modern technologies do not explicitly concern themselves with 'the full and heavy responsibility of managing all the resources - human and natural - of this planet'.

The effects of this irresponsibility are already evident in the disturbance of the finely adjusted ecological balances of nature through pollution, reckless use of resources, elimination or near elimination of various species (blue whales, for instance), destruction of forests, etc. The question is not one of the intrinsic value of stability in ecosystems, but of the inevitably engendered risks that modern technology brings in its wake. These risks derive from the fact that the effects of these technologies are invariably multiple, often uncontrolled and rarely predictable and foreseen. Further, the gravity of the risks vary from relatively trivial ones like automobile accidents to potentially catastrophic ones such as all-out nuclear warfare or destruction of the life-sustaining properties of the biosphere. Some of these risks may be cumulative, such as the build-up of nuclear wastes or of optically active pollutants - the atmosphere, or they may be discrete risks, like genetic engineering accidents.....

Comprehension:

Read the following passage and answer the questions :

Modern technology has been criticized because it is based on the assumption that nature is an inexhaustible source for the satisfaction of man's escalating resource needs and a limitless sink for his wastes. Modern technologies do not explicitly concern themselves with 'the full and heavy responsibility of managing all the resources - human and natural - of this planet'.

The effects of this irresponsibility are already evident in the disturbance of the finely adjusted ecological balances of nature through pollution, reckless use of resources, elimination or near elimination of various species (blue whales, for instance), destruction of forests, etc. The question is not one of the intrinsic value of stability in ecosystems, but of the inevitably engendered risks that modern technology brings in its wake. These risks derive from the fact that the effects of these technologies are invariably multiple, often uncontrolled and rarely predictable and foreseen. Further, the gravity of the risks vary from relatively trivial ones like automobile accidents to potentially catastrophic ones such as all-out nuclear warfare or destruction of the life-sustaining properties of the biosphere. Read the following passage and answer the questions :

The idea of time is involved in the idea of social structure also, because social structure means an arrangement of parts which has some permanence, endurance, durability, or repetitiveness. This raises the question of the span of time. In this connection, it is significant that whatever else sociologists may do, the base of their discipline lies in research involving direct observation of social phenomena by the techniques of participant observation, census, survey, questionnaire, interview, and so on. All such observations are carried out in a relatively short span of time, but when a sociologist makes general statements about society he stretches the time span: he makes them as if they are applicable over a longer period of time. As regards not-so-long spans of time (as for example, the time span involved in the development cycle in the household), sociologists have used biographical material and people's statements about their own past. The sociologist can be somewhat safe in stretching the time span of his observations on the basis of such information, although the dangers of putting complete faith in it are too well known to be stated here. As regards the study of social structure over long periods of time, however, use of historical material is inevitable. The point is that the sociologist blends the historical and the contemporary information to present a picture of social structure. It is easy to see that when he does this, he transcends the distinction between the synchronic and the diachronic, which a student of social change would make inevitably.
