Comprehension:

Special terms that need to be defined appear in all three types of studies: (a) qualitative, (b) quantitative, and (c) mixed methods. In qualitative studies, because of the inductive, evolving methodological design, inquirers may define few terms at the beginning; although they may advance tentative definitions. Instead, themes (or perspective or dimensions) may emerge through the data analysis. In the procedure section, authors define these terms as they surface during the process of research. This approach delays the definition of terms until they appear in the study, and it makes such definitions difficult to specify in advance in research proposals. For this reason, qualitative proposals often do not include separate sections for a definition of terms. Instead, writers pose tentative, qualitative definitions threaded throughout the study. In quantitative studies operating more within the deductive model of fixed and set research objectives, include extensive definitions early in the research proposal. Investigators may place them in separate sections and precisely define them. The researchers try to comprehensively define all relevant terms at the beginning of studies and to use accepted definitions found in the literature.

Read the passage given below and answer the questions that follow :

Climate change will affect more than the temperature and precipitation patterns of different climates around the world. The frequency of extreme weather events is also predicted to change. Sound evidence points to an increase in extreme weather events. The number of weather - related natural disasters has also gone up, with cyclone activity and above average rainfall - triggered by warmer sea and land temperature. Increased rainfall over extended periods will mainly lead to river flooding, while short, intense cloudbursts can cause physical floods. Due to changing climate, many parts of the world are already facing more frequent, severe, and longer lasting droughts. Droughts often have knock-on effects, for example on agriculture, forestry, water resources and biodiversity. They reduce water levels in rivers and ground water, stunt tree and crop growth. Further, human, animal and plant health also threatened by climate change. While climate change may not introduce new health hazards, it will worsen and amplify existing one. This trend of more, and more intense, weather events is one that will require international attention to mitigate disasters.

Read the passage given below and answer the questions that follow :

In the classical world, international migrations were considered as voluntary, rational attempts of the human beings to maximise utility and to attain social uplift. The migrants are considered to possess an intermediary character, which is little lower than that of the people at the place of destination and a little higher than that of the people at the place of origin. Thus, the migrants enter the new society at the lowest economic and social strata, but have opportunities for the improvement so that there is a progressive convergence of their characteristics with those of the host communities. This is how the functionalists looked at the international migrations.

The neo-Marxist model, however, presents quite a different picture of international migrations. Accordingly international migration is seen as coercive labour migration, which is a manifestation of dependency, which promotes underdevelopment in the periphery and overdevelopment at the core.

At present, there are very few countries in the world, which allow or encourage the immigration of foreigners on a permanent basis. The number of such countries, which still attract sizable immigrants, is still smaller. The magnitude of immigration for permanent settlement has been declining in almost all the receiving countries except the United States.

Thus, the migrants enter the new society at the lowest economic and social strata, but have opportunities for the improvement so that there is a progressive convergence of their characteristics with those of the host communities. This is how the functionalists looked at the international migrations.

The neo-Marxist model, however, presents quite a different picture of international migrations. Accordingly international migration is seen as coercive labour migration, which is a manifestation of dependency, which promotes underdevelopment in the periphery and overdevelopment at the core.

At present, there are very few countries in the world, which allow or encourage the immigration of foreigners on a permanent basis. The number of such countries, which still attract sizable immigrants, is still smaller. The magnitude of immigration for permanent settlement has been declining in almost all the receiving countries except the United States.

Comprehension:

Read the passage given below and answer the questions that follow :

In the classical world, international migrations were considered as voluntary, rational attempts of the human beings to maximise utility and to attain social uplift. The migrants are considered to possess an intermediary character, which is little lower than that of the people at the place of destination and a little higher than that of the people at the place of origin. Thus, the migrants enter the new society at the lowest economic and social strata, but have opportunities for the improvement so that there is a progressive convergence of their characteristics with those of the host communities. This is how the functionalists looked at the international migrations.

The neo-Marxist model, however, presents quite a different picture of international migrations. Accordingly international migration is seen as coercive labour migration, which is a manifestation of dependency, which promotes underdevelopment in the periphery and overdevelopment at the core.
